An example of this is the ability to automatically correct lens vignetting in RAW files without needing to crop them first. Then there's the familiar Easy Eraser, a tool that is nearly as old as Photoshop itself. Of course, it's been on the market for more than a decade. There's also a new Quick Mask Feature, which doesn't use a dragging tool or even a grid, but instead figures out the object or area you want to keep or remove by using an AI-based algorithm. The new Smart Sketches tool makes a good illustration, but needs to first be added to a vector PDF. Adobe Photoshop enters the field of AI, which is where many of its newest features have originated. These include both new standalone tools and inclusions to make Photoshop easier to use. Adobe is developing a deep learning program called Adobe Sensei. With this software, users will be able to create and use many of Photoshop's tools with minimal training. When users do need to train one of their new tools, the program will study the user's work and try to replicate it, making it less time consuming than typing out the command. Sample features so far include facial recognition, object detection, and speech recognition. The program is basically a kind of AI for Photoshop. Adobe's AI software is borne out of a belief that every pixel is a unique thing. It recognizes that some pixels are somewhat similar so it can use AI and machine learning to deal with them. Then it makes a decision as to what certain pixels are, such as a lip corner or other object within the image. Then it works to predict a color or pattern within that object among the rest of the image.
