I'm just looking at that "underclocked" manufacturer's specifications. SetFSB will not manage your RAM timings, so if you use another program to manage timings, or set them to AUTO, you should leave RAM timings at the default setting. 1. I realized that your "off" statement is incorrect. The "overclock" option in your menu is in fact "configure". Also, as said before, " SetFSB Overclock 3.0.3 Crack " is the current version but we don't have any crack or serial key for this. Our crack and serial key generator is disabled due to the fact that we don't want to support anyone who is using it illegally. In order to get this crack you have to illegally download it. SetFSB can accelerate your computer's speed and performance up to 5%, allowing you to take it to the next level, increase the number of applications you can run simultaneously and support higher quality games. This can increase computer speed by up to 200%. SetFSB can increase your computer's speed by up to 200% by creating extra modes in your BIOS. You can change the CPU speed, increase the RAM speed, or speed up your hard disk. Unlike other overclocking software, SetFSB is completely safe to use. The application has a lot of features. You can control the fan speed, the power-saving mode, and some other features. It's also possible to set different CPU options for each core. SetFSB has its own settings and you can enable or disable some options. It's important to note that SetFSB does not control the RAM timings and this is a serious mistake. If you use another RAM control application, you must leave the RAM timings at AUTO.

hi everybody, Is there anyone succeeded using setfsb?? i am using win 7 with ATI radeon hd 4670 and there is an old motherboard named as P4M800 ProPe E Motherboard, i have some trouble when i want to overclock my FSB. there is not PLL enable button. only PCI-E upper/lower mode button. the motherboard manual says "The PCI-E slots on the Intel Pentium M Processor Motherboard are broken-out onto a backplane that is independent of the motherboard. To make changes to the speed of the PCI-E Bus from the motherboard, the backplane is disabled from the PCI-E Parental Settings. To enable the backplane, you must enter the BIOS program and change the device location in the PCI-E Parental Settings from the default position and enter 0000. setFSB is a powerful set of tools to create a solid foundation for creating a safer, faster and more stable overclock. It will monitor your system and make adjustments in the registry to make your operating system use a higher FSB. This saves you from any performance or stability problems that might occur after the fact. setFSB contains the following tools: \* setPLL, setFSB and setPLLonline - to configure the PLL in a safe manner to make sure that everything in your system is in balance, and that your FSB settings are not going to cause your system to crash. \* setMon, setIOUPDATE, setTIMING, setTimeCALC, setASDATE, setCURTIME - to start/stop your system, to monitor the operation of your system or to calculate a timing table for setPLL. In addition to the product code, this license is often bundled with product codes or a
