Fiddler is a network traffic analyzer. It helps you find and fix problems on the network, test your web application or diagnose network and general performance issues. Fiddler lets you see all of the HTTP messages, including headers, cookies, and HTTPS requests, sent and received by your computer. You can also debug and modify the messages before they are sent or receive. Fiddler gives you an exceptional user experience as it allows you to see all data in real time, to modify the values, or to save it to a file. Fiddler supports HTTP and HTTPS, FTP, and SOCKS proxies, including proxying HTTP and HTTPS requests from Internet Explorer, and the ability to debug and modify HTTP messages without having to "reconnect" to the site. Fiddler does not modify any data on the client. It captures and displays data without modifying its transmission, and it does not store or save this data. This means that Fiddler does not interfere with the connections or data transfers between you and the sites that you are connecting to. Fiddler does not use any user configuration and has no storage of any type. Advantages: · The ability to see all traffic as it occurs. · The ability to change data within the request before it is sent. · The ability to debug web applications on your client. · The ability to see HTTP POST data and all cookies and headers as they are sent. · The ability to upload files to the site without having to "reconnect" to the site. · The ability to see all request/response header data as it occurs, including cookies and headers. · The ability to save information to a file as it occurs. · The ability to see HTTP responses as they occur. · The ability to pass arguments to the client as the request occurs. · The ability to see all responses as they occur. · The ability to examine all cookies and forms without "reconnecting" to the site. · The ability to support multiple sessions. · The ability to set
