In this Application, there are a new features such as the ability to add a layer

so that adds a text box of a specific size within the layer. This information can be the name of the person, or the date. It's possible to change the orientation of text in a certain way. Lightroom is my main camera RAW app. During the transition I've realized that Lightroom 5 will do a better job importing my DNG files than Lightroom 4 did. The ability to leave certain settings as LR4 defaults worked well in some situations, but it can be time consuming for weekly photo sessions. While finalizing the Lightroom 4 import process, I always ended up wasting a fair amount of time manually setting the Import Defaults settings. Perhaps I just have more patience than some people, but I enjoy having complete control over the settings. With Lightroom 5 there are only a couple of minor changes you need to follow up on when importing files into Lightroom 5. Now, the default is to select "Verbose" import options, but I disabled that setting. Most DNG files that I have been working with came with the options selected. In any case, it's worth spending a few more minutes setting the Import Defaults before trying to import your DNG files into Lightroom 5, and about half the import time I previously wasted is now saved. I am still unable to set import defaults with DNG files exported by a DNG viewer. A minor nit, but I guess I should have expected it. As I mentioned in the previous section, the new "Blend Mode" layer introduced in Lightroom 5 will drastically impact your workflow. Previously the number of layers you could have without performance issues was a maximum of 6. Now the number rises to the magical 15. When you have more than 6 layers – like the example above – it's extremely easy to hit performance issues with Lightroom 5. Adobe has made a pretty good connection between its Inspector tools and "Blend Mode". This seems to have resulted in some unintended transparency flow in places I hadn't expected it. In order to compensate for these issues in my workflow, I went away from using "Blend Mode" on the second, third and fourth layers. I went back to save space on your hard drive when the images are exported, but this does affect the look of the final image. If you're in the habit of using the "Blend Mode" layer, you'll need to make sure you pay attention to how the layer is being handled. There's also the possibility of getting some "Synchronization" errors due to overlapping layer opacity. The color choices you make in the Inspector are actually an expert mode tool. Your settings are not altered until you "Save As". So, when you give a single pixel a black foreground color, and do not select "Invert" for the color, the pixel will actually remain black until viewed with "Save As", and your settings are actually saved along with a file name.
