The gradient tool is one of the most powerful tools in Photoshop. You can make your own colors with the Hue/Saturation button, and apply it to just one or more layers in your Canvas. It is not possible to apply the gradient to a transparent layer. The gradient must be applied to a semi-transparent area of the layer. Managing large files can be a tricky task. By using various web techniques, such as using High Resolution Timelines (WICDH) , Signals Timeline , and others, Photoshop can work directly to the vector layer directly in the browser, with no loss in quality, no computer overhead, and little processing overhead. How it works Creating images larger than the browser's page can create a big file. If you're looking for something efficient or have a lot of photos or documents to work with, a pre-sized canvas makes it easy to work with very large image files on the web. Current canvas sizes are 912px by 864px, with a resolution of 300dpi (dots per inch). The benefits of working in this large size are improved performance, efficiency and file size, but also a simpler canvas. In order for Photoshop to be able to handle layers that are larger than the size of the canvas, there are two options. Option one: Using a **SCL resolution** and creating the canvas in the 's % property . In this way, we can achieve up to 2048 pixels to the size of the viewport (and the browser window or "browser tab"). Option two: Using a **Pixel aspect ratio** and a CSS px value and creating the canvas in the **canvas: auto** CSS property. In this way, we can achieve up to 1920x1440px (the equivalent of a 4K canvas) to the size of the viewport (and the browser window or "browser tab"). 933d7f57e6
