Of course, if you create your own actions and make them updateable, Adobe has its own Actions panel where you can find them. I'm an old Photoshop guy, and most of the time I just need to convert a bunch of files to say jpegs, but when I really need Photoshop power and a good workflow, it's hard for me to justify the expense, and the programs are not all that similar. Between Lightroom and Photoshop, you can get all the features I use in a single package for a lot less cost. One of the big features of Lightroom 6 is the integration of the Adobe Cloud. All of your metadata is now stored in the cloud in addition to the actual image files. If you have a mobile device that can connect to the internet, you can sync your photo library to it. In addition to this, you also have the option to pull in images from the cloud to add to an existing collection in Lightroom. This is very convenient since you don't need to synchronize all of your photos for example when you move to a new computer. I found the Photoshop app to be fast and responsive on the MacBook Pro, with no noticeable latency. As a caveat with any GPU-intensive app, the program began to stutter when I used the Denoise effect. Photoshop is one of many programs that benefit from a high-end video card, and while the MacBook Pro is powerful enough to perform many tasks, it's not a professional workhorse. This should be taken into consideration as you try out the latest version of Photoshop.
